1. Identity

Document	STAR-PKG-STAR-IOD-EN · v2.2 · 2026-11-02
Package	star-iod
Version	0.1.0
Capability	star.orbit.iod-gibbs
Maturity	Released & Verified (RELEASED)
Python	⩾3.9
Source commit	dc09f61d
Source	https://github.com/Andrea07072000/S.T.A.R.-/tree/main/packages/star_iod

2. Licence and obligations

Apache License 2.0. You may use, copy, modify and distribute it, also commercially, and you receive a patent licence from the contributors. When you redistribute it: keep the LICENSE file and the copyright notices (and a NOTICE file, if a future version adds one), and state in modified files that you changed them. You may not use the S.T.A.R. name to endorse your product.

3. What it needs at run time

Nothing beyond the Python standard library: it works offline.

4. Integrity

SHA-256 fingerprints of the files published on this website. Check a downloaded file with:

```
python -c "import hashlib,sys;print(hashlib.sha256(open(sys.argv[1],'rb').read()).hexdigest())" star_iod-0.1.0-py3-none-any.whl
```

FILE	SHA-256
star_iod-0.1.0-py3-none-any.whl	e1c3c2b16a5cfa1abc3c1884ad6b844cf45dd0bf99eea3ecf6c472580ed0fc90
star_iod.py	6a2072071e695d5209723ff1f667502faff9e7f3c5683732a9765f1e4878d01e
star_iod-0.1.0-source.zip	5165c55ddab73dfa72aed09e3905aa646cc459430059025d9cbd581c47c32643

5. What it does, and its limits

Velocity at the middle of three position vectors by Gibbs' method (cancellation-free form) and Herrick-Gibbs, with the measured domain of each (crossover near 0.4 degrees), agreement with Orekit IodGibbs within 8e-9 and explicit refusal of non-coplanar, collinear or impossible geometry.

Perfect positions in, velocity out: no measurement noise model, no covariance, no angles-only methods (Gauss, Laplace, Gooding), no differential correction. With noisy fixes the error of either method is dominated by the noise divided by the arc length, not by the figures above.

- `gibbs(r1, r2, r3, mu, coplanar_tol_deg=3)`: Vallado Algorithm 54. Reproduces Example 7-3 within 5e-7 km/s. The direction of motion is the order r1, r2, r3. The sums of the textbook form are written with differences of neighbouring vectors: at 0.02 degrees of spacing the error is 2e-8 relative instead of 1.5e-5.
- `herrick_gibbs(r1, r2, r3, t1, t2, t3, mu, coplanar_tol_deg=3)`: Vallado Algorithm 55, for closely spaced positions; `separation_deg` returns the two angles.
- Measured domains (240 known orbits, largest relative velocity error by spacing in mean anomaly):
- Every function returns three finite floats or raises `ValueError`: wrong shapes, non-numeric, boolean, NaN or infinite input; a zero position; mu <= 0; positions further than `coplanar_tol_deg` from a common plane; collinear or coincident positions; positions through which no orbit about the centre passes (Gibbs); times not strictly increasing (Herrick-Gibbs).

6. Export, use and certification

The package is published and freely available. That usually takes software out of export-control lists, but not every use of it: read the page on space activities and export control before using it in a controlled programme. It is not certified or qualified for flight; the evidence describes what was tested and how.

7. Citation and bill of materials

```
@software{cavazzini_star_iod_0_1_0,
  author  = {Cavazzini, Andrea},
  title   = {{star-iod}: Velocity from three positions (Gibbs, Herrick-Gibbs)},
  version = {0.1.0},
  year    = {2026},
  url     = {https://andrea07072000.github.io/S.T.A.R.-/software/star_iod/},
  note    = {Apache-2.0. Source: https://github.com/Andrea07072000/S.T.A.R.-, commit dc09f61d}
}
```
