1. Identity

Document	STAR-PKG-STAR-SPLINE-EN · v2.2 · 2026-11-02
Package	star-spline
Version	0.1.0
Capability	star.numerics.cubic-spline
Maturity	Released & Verified (RELEASED)
Python	⩾3.9
Source commit	dc09f61d
Source	https://github.com/Andrea07072000/S.T.A.R.-/tree/main/packages/star_spline

2. Licence and obligations

Apache License 2.0. You may use, copy, modify and distribute it, also commercially, and you receive a patent licence from the contributors. When you redistribute it: keep the LICENSE file and the copyright notices (and a NOTICE file, if a future version adds one), and state in modified files that you changed them. You may not use the S.T.A.R. name to endorse your product.

3. What it needs at run time

Nothing beyond the Python standard library: it works offline.

4. Integrity

SHA-256 fingerprints of the files published on this website. Check a downloaded file with:

```
python -c "import hashlib,sys;print(hashlib.sha256(open(sys.argv[1],'rb').read()).hexdigest())" star_spline-0.1.0-py3-none-any.whl
```

FILE	SHA-256
star_spline-0.1.0-py3-none-any.whl	56ad1ff97c2c21da3e85474d32141c6539acbc65d8804ba41b785d390c5b2a31
star_spline.py	194f69e9c6c0fbff1da40334159cbb1bc4cfa95b2761aec47ce12c65d5ca5876
star_spline-0.1.0-source.zip	9b2aa3b7bf7e4b3d39acf0cc7ece01b2abc35a51b745382d80d54ac9856e021a

5. What it does, and its limits

Natural cubic spline through 2 to 300 tabulated points: values, first derivative, second derivatives at the knots and integral, with the tridiagonal system solved in exact rational arithmetic and every result rounded once; within 8e-15 of SciPy and Hipparchus on 151 unevenly spaced tables.

The natural end condition only (zero second derivative at both ends): no clamped, not-a-knot or periodic spline, no smoothing spline, no extrapolation. A spline through noisy or unevenly sampled data can overshoot between the knots; exact arithmetic does not make it a good model. Exact arithmetic is slow: about a second for a table of 300 knots, and every call solves the table again (pass all the points you need in one call). Nothing beyond 300 knots. "Nearest float" refers to the floats passed in, not to the decimal numbers you may have meant.

- `values(xs, ys, points)` and `derivatives(xs, ys, points)` return the natural cubic spline through the points (xs strictly increasing) and its first derivative at each point; `second_derivatives(xs, ys)` its second derivative at the knots (zero at the two ends); `integral(xs, ys, a, b)` its integral between two abscissas of the table.
- The tridiagonal system is solved in exact rational arithmetic on the floats given and each result is evaluated exactly and rounded once: knots very close together, values far from zero or a long table cost no digit.
- Measured on 151 tables of 3 to 40 unevenly spaced knots, 25 points each: values within 8e-15 and first derivatives within 2e-14 of SciPy (relative to the scale of each table), second derivatives within 2e-12, the integral within 3e-13; values within 7e-15 and first derivatives within 2e-15 of Hipparchus.
- Every function returns floats or raises `ValueError`: tables that are not 2 to 300 finite real numbers within 1e100, different lengths, knots that are not strictly increasing, a point outside the table (a spline is not extrapolated), a result too large for a float.

6. Export, use and certification

The package is published and freely available. That usually takes software out of export-control lists, but not every use of it: read the page on space activities and export control before using it in a controlled programme. It is not certified or qualified for flight; the evidence describes what was tested and how.

7. Citation and bill of materials

```
@software{cavazzini_star_spline_0_1_0,
  author  = {Cavazzini, Andrea},
  title   = {{star-spline}: Natural cubic spline, correctly rounded},
  version = {0.1.0},
  year    = {2026},
  url     = {https://andrea07072000.github.io/S.T.A.R.-/software/star_spline/},
  note    = {Apache-2.0. Source: https://github.com/Andrea07072000/S.T.A.R.-, commit dc09f61d}
}
```
