5. What it does, and its limits

Screening of close approaches between objects of TLE catalogues (who to look at), NOT a collision-probability tool.

Probability of collision, covariance, manoeuvre advice, accuracy below the ~1 km TLE error. Advisory screening only.

- `screen(tle_paths, start, hours, step, coarse_km, final_km, cross_only, refine)` returns encounters (TCA in UTC, miss distance km, age of the older TLE) below `final_km`, excluding pairs that stay close (formations).
- TLEs are propagated with SGP4 only (mean elements); propagation errors are reported, never replaced.
- `refine_tca(state_at, step)`: closed-form TCA from relative motion, shared by screening and tests.

6. Export, use and certification

The package is published and freely available. That usually takes software out of export-control lists, but not every use of it: read the page on space activities and export control before using it in a controlled programme. It is not certified or qualified for flight; the evidence describes what was tested and how.
