Document	STAR-PKG-STAR-TABINT-EN · v2.1 · 2026-11-01
Package	star-tabint
Version	0.1.0
Capability	star.numerics.tabulated-integral
Maturity	RELEASED
Python	⩾3.9
Source commit	94fcf7c
Source	https://github.com/Andrea07072000/S.T.A.R.-/tree/main/packages/star_tabint

2. Licence and obligations

Apache License 2.0. You may use, copy, modify and distribute it, also commercially, and you receive a patent licence from the contributors. When you redistribute it: keep the LICENSE file and the copyright notices (and a NOTICE file, if a future version adds one), and state in modified files that you changed them. You may not use the S.T.A.R. name to endorse your product.

3. What it needs at run time

Nothing beyond the Python standard library: it works offline.

4. Integrity

SHA-256 fingerprints of the files published on this website. Check a downloaded file with:

```
python -c "import hashlib,sys;print(hashlib.sha256(open(sys.argv[1],'rb').read()).hexdigest())" star_tabint-0.1.0-py3-none-any.whl
```

FILE	SHA-256
star_tabint-0.1.0-py3-none-any.whl	7d6bf8fdb18b2cbca7a24c982c57b0d33bd7ea1c18c99abf7f4a061a8459de46
star_tabint.py	55b09f2a14330272da5dac0e7159e5ca39158ea4462778a39897e50a3bc5ab44
star_tabint-0.1.0-source.zip	48a3dc4e0c9f678520663c2e7d1349acf38b23542596fefe09ef2cc621761b7e

5. What it does, and its limits

Trapezoid rule on any strictly increasing grid, its running integral and the composite Simpson rule for equally spaced samples, each evaluated exactly in rational arithmetic and rounded once; on 500 tables (1750 values) every value is identical to the exact rational value from SymPy, and NumPy and SciPy agree within 3.3e-16 of the sum of the absolute panel areas.

The value of a quadrature RULE on the samples, not the integral of the underlying function: the error of the rule (of order h^2 for the trapezoid, h^4 for Simpson on smooth data) is not estimated, and noisy or sparse samples give a correspondingly poor integral. No Simpson rule for unequal spacing or an even number of points, no higher-order rules, no extrapolation. "Exact" refers to the floats supplied. Exact arithmetic is slower than floating point.

- `trapezoid(xs, ys)` integrates the piecewise-linear curve through the points (xs strictly increasing, any spacing); `cumulative` returns the integral from the first point up to each point; `simpson(ys, step)` applies the composite Simpson rule to an odd number of equally spaced values.
- Each result is the float nearest to the exact value of the rule on the numbers given: lobes that cancel lose nothing, and every element of `cumulative` is rounded from its own exact partial sum.
- Measured on 500 tables of 2 to 60 points (1750 values): every value identical to the exact rational value (SymPy) rounded once; NumPy and SciPy within 3.3e-16 of the sum of the absolute panel areas.
- Every function returns floats or raises `ValueError`: tables that are not lists or tuples of 2 to 100000 finite numbers within 1e100, different lengths, abscissas not strictly increasing, an even number of values or an invalid step for Simpson.

6. Export, use and certification

The package is published and freely available. That usually takes software out of export-control lists, but not every use of it: read the page on space activities and export control before using it in a controlled programme. It is not certified or qualified for flight; the evidence describes what was tested and how.

7. Citation and bill of materials

```
@software{cavazzini_star_tabint_0_1_0,
  author  = {Cavazzini, Andrea},
  title   = {{star-tabint}: Integrals of tabulated data, correctly rounded},
  version = {0.1.0},
  year    = {2026},
  url     = {https://andrea07072000.github.io/S.T.A.R.-/software/star_tabint/},
  note    = {Apache-2.0. Source: https://github.com/Andrea07072000/S.T.A.R.-, commit 94fcf7c}
}
```
