Evidence and verification disclaimer

What a S.T.A.R. result establishes, and what it does not.

Document ID	STAR-LEGAL-EVIDENCE-EN
Version	1.3
Date	2026-10-16
Jurisdiction	Italy and the European Union
Language	English (an Italian version is published; for users in Italy the Italian text prevails)
Owner	Andrea Cavazzini
Legal review	not yet performed by a lawyer — requested before any paid service
Next review	2027-04-15 or at any change of service

What a published result establishes

That, for the inputs listed and with the software versions recorded, two or more implementations gave results that agree within the tolerance stated; or, where stated, that a result matches a published reference value or a value derived by hand. Every result names its inputs, versions, tolerance and evidence file.

What it does not establish

- That the software is correct for inputs that were not tested.
- That two implementations are independent beyond what is declared: shared algorithms, libraries or data are stated when known.
- Agreement between implementations is not proof that any of them is right; it is evidence that an error, if present, is shared.
- Any certification, accreditation or qualification under ECSS, DO-178C, NASA standards or any other scheme.
- Fitness for flight, for operational collision avoidance or for any safety-critical decision.

Maturity

S.T.A.R. software is at prototype maturity (technology readiness level 6 at most). Hardware results are obtained on emulators (Renode), not on physical boards.

Status labels

- **RELEASED**: installed from a fixed version, its tests pass, compared with at least two independent libraries, mutation score of the tests at least 0.85.
- **AGREE**: the implementations agree within the stated tolerance on the stated cases.
- **COMING SOON**: described but not available.

Responsibility

Whoever uses a result remains responsible for the decisions taken with it. In an engineering assessment, the scope, the cases and the limits are agreed in writing before the work starts.
