Compliance sheet — star-calendar

Everything a supplier qualification, a legal review or an export check usually asks about star-calendar 0.1.0, in one document.

1. Identity

Document	STAR-PKG-STAR-CALENDAR-EN · v1.3 · 2026-10-16
Package	star-calendar
Version	0.1.0
Capability	star.time.calendar
Maturity	RELEASED
Python	⩾3.9
Source commit	94fcf7c
Source	https://github.com/Andrea07072000/S.T.A.R.-/tree/main/packages/star_calendar

2. Licence and obligations

Apache License 2.0. You may use, copy, modify and distribute it, also commercially, and you receive a patent licence from the contributors. When you redistribute it: keep the LICENSE file and the copyright notices (and a NOTICE file, if a future version adds one), and state in modified files that you changed them. You may not use the S.T.A.R. name to endorse your product.

3. What it needs at run time

Nothing beyond the Python standard library: it works offline.

4. Integrity

SHA-256 fingerprints of the files published on this website. Check a downloaded file with:

```
python -c "import
hashlib,sys;print(hashlib.sha256(open(sys.argv[1],'rb').read()).hexdigest())" star_calendar-
0.1.0-py3-none-any.whl
```

FILE	SHA-256
star_calendar-0.1.0-py3-none-any.whl	592b97f20dc27341667b0bf69fa92f8dc8fd91b56634a9c4cd0a08aa6fdea33f
star_calendar.py	5f13630e7f6b18a15f81f71232bdde3fb705581e12123545f47f30302d4d7e29
star_calendar-0.1.0-source.zip	aa25e2a14cee8e9ebfaff04852e69292aeab3ac2b90eb843e54399a08c61a298

5. What it does, and its limits

Exact integer conversion between calendar dates and Julian Day Numbers in the Julian, proleptic Gregorian and civil calendars from JDN 0 to year 9999; identical to ERFA, CPython datetime and NAIF SPICE on 9014 dates, and dates that do not exist are refused.

A calendar, not a time scale: no leap seconds, no UTC/TT/TDB conversion, no time zones, no local adoption dates of the Gregorian calendar (the civil switch is the papal one of October 1582).

- `jdn(year, month, day, calendar)` and `calendar_date(jdn, calendar)` for `"gregorian"`, `"julian"` and `"auto"` (Julian up to 1582-10-04, Gregorian from 1582-10-15); astronomical year numbering; valid from JDN 0 to 9999-12-31.
- `julian_date(...)` returns the pair (JD at the preceding midnight, fraction of day): the sum is the Julian Date and the pair keeps a nanosecond that a single float would lose. `weekday(jdn)` (0 = Monday), `day_of_year(...)`.
- Measured: the same day number as ERFA, CPython `datetime` and NAIF SPICE (MIXED calendar) on 9014 dates, zero mismatches, including years B.C. and every day around the 1582 switch.
- Every function returns integers (or the documented pair) or raises `ValueError`: non-integer or boolean year, month, day or day number; a date that does not exist in the calendar (29 February 1900 Gregorian, 1582-10-05 to 1582-10-14 civil); an unknown calendar; a time outside the day; anything outside the valid range.

6. Export, use and certification

The package is published and freely available. That usually takes software out of export-control lists, but not every use of it: read the page on space activities and export control before using it in a controlled programme. It is not certified or qualified for flight; the evidence describes what was tested and how.

7. Citation and bill of materials

```
@software{cavazzini_star_calendar_0_1_0,
  author  = {Cavazzini, Andrea},
  title   = {{star-calendar}: Calendar dates and Julian day numbers, exactly},
  version = {0.1.0},
  year    = {2026},
  url     = {https://andrea07072000.github.io/S.T.A.R.-/software/star_calendar/},
  note    = {Apache-2.0. Source: https://github.com/Andrea07072000/S.T.A.R.-, commit 94fcf7c}
}
```
