Compliance sheet — star-wahba

Everything a supplier qualification, a legal review or an export check usually asks about star-wahba 0.1.0, in one document.

1. Identity

Document	STAR-PKG-STAR-WAHBA-EN · v1.3 · 2026-10-16
Package	star-wahba
Version	0.1.0
Capability	star.attitude.wahba
Maturity	RELEASED
Python	⩾3.9
Source commit	94fcf7c
Source	https://github.com/Andrea07072000/S.T.A.R.-/tree/main/packages/star_wahba

2. Licence and obligations

Apache License 2.0. You may use, copy, modify and distribute it, also commercially, and you receive a patent licence from the contributors. When you redistribute it: keep the LICENSE file and the copyright notices (and a NOTICE file, if a future version adds one), and state in modified files that you changed them. You may not use the S.T.A.R. name to endorse your product.

3. What it needs at run time

Nothing beyond the Python standard library: it works offline.

4. Integrity

SHA-256 fingerprints of the files published on this website. Check a downloaded file with:

```
python -c "import
hashlib,sys;print(hashlib.sha256(open(sys.argv[1],'rb').read()).hexdigest())" star_wahba-
0.1.0-py3-none-any.whl
```

FILE	SHA-256
star_wahba-0.1.0-py3-none-any.whl	7bb53412034284d4b2ab0fa959fb7b0edc4a2445b61f915f91d7e3562e1cdc4c
star_wahba.py	57b35fe5a36575980d5786d657acbbf2c919dff6f7ed5034b7875fd530c2533b
star_wahba-0.1.0-source.zip	b504d3eb68d5414d3cb6a48cfa00786b8942268a599f12b4174b8440e9347387

5. What it does, and its limits

Attitude from vector observations: TRIAD for two directions and Davenport's q-method (Wahba's problem) for 2 to 1000 weighted directions, with the eigenproblem solved by Jacobi rotations in the standard library; conversion to the attitude matrix and the Wahba loss; within 7e-15 of SciPy's SVD solution and 5e-16 of ahrs TRIAD on 401 attitudes.

A single-frame estimate: no filtering over time, no gyro, no covariance of the estimate, no bias estimation, no QUEST or ESOQ variants (they solve the same problem faster; this one favours robustness over speed). TRIAD and the q-method give different answers on noisy data by design: TRIAD trusts the first observation entirely. Nearly parallel observations are accepted down to 1e-12 and give an attitude that is very sensitive to noise about their common direction: the functions do not warn about it. No published numerical example is reproduced: the references (Wahba 1965, Black 1964, Davenport 1968, Markley and Crassidis) are cited for the method.

- `triad(r1, r2, b1, b2)` returns the attitude matrix A (reference to body, b = A r) that matches the first pair exactly; `q_method(refs, bodies, weights)` returns the unit quaternion (w, x, y, z), w >= 0, that minimises Wahba's loss; `rotation_matrix(q)` converts it to A; `wahba_loss` evaluates 0.5 Σ w |b - A r|² with the weights normalised to sum 1.
- TRIAD by two orthonormal triads; the q-method by the eigenvector of the largest eigenvalue of Davenport's K matrix, found with Jacobi rotations. Vectors need not be unit: only their directions are used.
- Measured on 401 attitudes with 2 to 8 weighted directions, half of them with 0.01 rad of noise: the q-method agrees with the singular-value solution of SciPy within 7e-15 in every element of

the matrix, TRIAD with the TRIAD of ahrs within 5e-16.

- Every function returns floats or raises `ValueError`: vectors that are not three finite numbers or are zero, fewer than 2 or more than 1000 pairs, weights that are not positive, directions that do not fix an attitude (parallel), a zero quaternion.

6. Export, use and certification

The package is published and freely available. That usually takes software out of export-control lists, but not every use of it: read the page on space activities and export control before using it in a controlled programme. It is not certified or qualified for flight; the evidence describes what was tested and how.

7. Citation and bill of materials

```
@software{cavazzini_star_wahba_0_1_0,
