Compliance sheet — star-twobody

Everything a supplier qualification, a legal review or an export check usually asks about star-twobody 0.1.0, in one document.

1. Identity

Document	STAR-PKG-STAR-TWOBODY-EN · v1.2 · 2026-10-15
Package	star-twobody
Version	0.1.0
Capability	star.orbit.twobody-quantities
Maturity	RELEASED
Python	⩾3.9
Source commit	94fcf7c
Source	https://github.com/Andrea07072000/S.T.A.R.-/tree/main/packages/star_twobody

2. Licence and obligations

Apache License 2.0. You may use, copy, modify and distribute it, also commercially, and you receive a patent licence from the contributors. When you redistribute it: keep the LICENSE and NOTICE files, keep the copyright notices, and state in modified files that you changed them. You may not use the S.T.A.R. name to endorse your product.

3. What it needs at run time

Nothing beyond the Python standard library: it works offline.

4. Integrity

SHA-256 fingerprints of the files published on this website. Check a downloaded file with:

```
python -c "import
hashlib,sys;print(hashlib.sha256(open(sys.argv[1],'rb').read()).hexdigest())" star_twobody-
0.1.0-py3-none-any.whl
```

FILE	SHA-256
star_twobody-0.1.0-py3-none-any.whl	6865261c561184887fb36d35a0eafe82e4b2d65ff6a3a56ab2ae110151abf8e6
star_twobody.py	a5fbb4728763581f60553dfc5abfe3fad23c6a34055d5b8524d68dedfcdc947e
star_twobody-0.1.0-source.zip	7a95c993691f5e50a4cd2d8b326a19dc9adedaa1561132360f6a9b2105a712fc

5. What it does, and its limits

Period, mean motion, circular and escape speed, apsis radii and speeds and specific energy of a two-body ellipse; within 4e-14 relative of SPICE for any gravitational parameter and 2.6e-14 of hapsira on 600 orbits; reproduces the geostationary orbit and refuses non-elliptic input.

Two-body motion only: the real period of a low orbit differs by seconds because of the Earth's oblateness (see `star_j2` for the nodal period). Ellipses only: no parabolic or hyperbolic orbits. No position along the orbit (see `star_kepler`) and no manoeuvres (see `star_maneuver`). The result is as good as the mu supplied.

- `period`, `semi_major_axis_from_period`, `mean_motion`: Kepler's third law, for the Earth by default or any mu. Reproduce the geostationary orbit (one sidereal day at 42164.17 km).
- `circular_speed`, `escape_speed`, `apsides`, `elements_from_apsides`, `apsis_speeds`, `specific_energy`, consistent with each other: angular momentum and energy are the same at the two apsides.
- Measured on 600 orbits (a 6600 to 400000 km, e 0 to 0.95, 100 circular): within 4e-14 relative of SPICE for a gravitational parameter from the Moon's to the Sun's, and within 2.6e-14 of hapsira on the Earth.
- Every function returns finite floats or raises `ValueError`: non-numeric, boolean, NaN or infinite input, a length, period or mu outside [1e-30, 1e30] (zero and negative values included), an eccentricity outside [0, 1), an apoapsis below the periapsis by more than rounding.

6. Export, use and certification

The package is published and freely available. That usually takes software out of export-control lists, but not every use of it: read the page on space activities and export control before using it in a controlled programme. It is not certified or qualified for flight; the evidence describes what was tested and how.

7. Citation and bill of materials

```
@software{cavazzini_star_twobody_0_1_0,
  author  = {Cavazzini, Andrea},
  title   = {{star-twobody}: The sizes and speeds of a Keplerian ellipse},
  version = {0.1.0},
  year    = {2026},
  url     = {https://andrea07072000.github.io/S.T.A.R.-/software/star_twobody/},
  note    = {Apache-2.0. Source: https://github.com/Andrea07072000/S.T.A.R.-, commit 94fcf7c}
}
```
