1. Identity

Document	STAR-PKG-STAR-GEODESIC-EN · v1.4 · 2026-10-20
Package	star-geodesic
Version	0.1.0
Capability	star.geodesy.geodesic
Maturity	RELEASED
Python	⩾3.9
Source commit	94fcf7c
Source	https://github.com/Andrea07072000/S.T.A.R.-/tree/main/packages/star_geodesic

2. Licence and obligations

Apache License 2.0. You may use, copy, modify and distribute it, also commercially, and you receive a patent licence from the contributors. When you redistribute it: keep the LICENSE file and the copyright notices (and a NOTICE file, if a future version adds one), and state in modified files that you changed them. You may not use the S.T.A.R. name to endorse your product.

3. What it needs at run time

Nothing beyond the Python standard library: it works offline.

4. Integrity

SHA-256 fingerprints of the files published on this website. Check a downloaded file with:

```
python -c "import hashlib,sys;print(hashlib.sha256(open(sys.argv[1],'rb').read()).hexdigest())" star_geodesic-0.1.0-py3-none-any.whl
```

FILE	SHA-256
star_geodesic-0.1.0-py3-none-any.whl	772da1f8f50ba4369b073ab80217b82567768ae0a45a0e60163193fbb06a614c
star_geodesic.py	f5aff1696713eba4ebc9d19c6b5e55e9fb85b64cfe185090a200c283dec8f661
star_geodesic-0.1.0-source.zip	eec92c1cec3239badfe43b2d8bbf28e41b047ab9e7310b9326f3d6703e59bac4

5. What it does, and its limits

Inverse and direct geodesic problems on WGS-84 with bounded iterations: measured within 0.08 mm of PROJ, GeographicLib and PyGeodesy; nearly antipodal points are refused, an unconverged value is never returned.

Vincenty's method, not Karney's: points closer than about half a degree to the antipode are refused, not solved (the 40 pairs within 2 degrees of the antipode in the corpus all converged). No geoid, no height: lines on the ellipsoid.

- `inverse(lat1, lon1, lat2, lon2)`: geodesic length in metres and its azimuth at both ends in the direction of travel (degrees from North towards East, in [0, 360)). Reproduces the published line Flinders Peak - Buninyong (54972.271 m) within 0.2 mm and 0.004 arcsec.
- `direct(lat1, lon1, azimuth1_deg, distance_m)`: latitude, longitude in [-180, 180) and azimuth at the point reached, for distances from 0 to 20 000 km.
- Measured against PROJ, GeographicLib and PyGeodesy (exact) on 840 problems: distance within 0.08 mm at any length, 2 nm below 1 km; azimuth within 0.0003 arcsec; direct position within 0.07 mm. Two iterations are run after the 1e-12 rad tolerance is met: without them a 0.7 m line was 2.7 micrometres off.
- Every call returns three finite floats or raises: `ValueError` for non-numeric, boolean, NaN, infinite input, latitude outside [-90, 90], longitude or azimuth outside [-360, 360], distance outside [0, 20 000 km]; `RuntimeError` for antipodal points (the geodesic is not unique) and when the iteration does not converge within 200 steps (nearly antipodal points). An unconverged value is never returned. Coincident points give (0, 0, 0).

6. Export, use and certification

The package is published and freely available. That usually takes software out of export-control lists, but not every use of it: read the page on space activities and export control before using it in a controlled programme. It is not certified or qualified for flight; the evidence describes what was tested and how.

7. Citation and bill of materials

```
@software{cavazzini_star_geodesic_0_1_0,
  author  = {Cavazzini, Andrea},
  title   = {{star-geodesic}: Distance and azimuth on the WGS-84 ellipsoid},
  version = {0.1.0},
  year    = {2026},
  url     = {https://andrea07072000.github.io/S.T.A.R.-/software/star_geodesic/},
  note    = {Apache-2.0. Source: https://github.com/Andrea07072000/S.T.A.R.-, commit 94fcf7c}
}
```
