1. Identity

Document	STAR-PKG-STAR-ROTFRAME-EN · v2.2 · 2026-11-02
Package	star-rotframe
Version	0.1.0
Capability	star.frames.rotating-z
Maturity	Released & Verified (RELEASED)
Python	⩾3.9
Source commit	dc09f61
Source	https://github.com/Andrea07072000/S.T.A.R.-/tree/main/packages/star_rotframe

2. Licence and obligations

Apache License 2.0. You may use, copy, modify and distribute it, also commercially, and you receive a patent licence from the contributors. When you redistribute it: keep the LICENSE file and the copyright notices (and a NOTICE file, if a future version adds one), and state in modified files that you changed them. You may not use the S.T.A.R. name to endorse your product.

3. What it needs at run time

Nothing beyond the Python standard library: it works offline.

4. Integrity

SHA-256 fingerprints of the files published on this website. Check a downloaded file with:

```
python -c "import hashlib,sys;print(hashlib.sha256(open(sys.argv[1],'rb').read()).hexdigest())" star_rotframe-0.1.0-py3-none-any.whl
```

FILE	SHA-256
star_rotframe-0.1.0-py3-none-any.whl	88531cc119cf59f869ca550cc8df1e4331a2451053132b3b4bb2286843b9d42a
star_rotframe.py	a7e8682356b258cd2b7ed91f3f67657d8f0b25ce4afa2ee1c93e8d7b77506cd2
star_rotframe-0.1.0-source.zip	f1fc98740f0709b6e41fc2695bba46408cf2e6e2b97032b62c12fa5f6629a12f

5. What it does, and its limits

Position and velocity between an inertial frame and a frame rotating about z at a given angle and rate, transport term included, in both directions; on 600 states there and back the results agree with NAIF SPICE (rav2xf), SciPy and astropy within 5.2e-16 of |r| and of |v| + |rate| |r|.

A rotation about one fixed axis at a constant rate. For the Earth this leaves out polar motion, precession, nutation and the variation of the length of day: this module is NOT a full ICRS-to-ITRS transformation, and the angle (Earth Rotation Angle or sidereal time) must come from elsewhere (see `star_era` in this repository). Over a day the neglected terms move a ground point by metres to tens of metres. No acceleration (Coriolis and centrifugal terms) is returned. Units are whatever the caller uses, consistently.

- `to_rotating(r, v, angle, rate)` returns r' = Rz(angle) r and v' = Rz(angle) v − w × r', with w = (0, 0, rate): the velocity seen in the rotating frame, transport term included. `angle` is in radians, about +z.
- `to_inertial` is the exact inverse. The default rate is the WGS-84 angular velocity of the Earth, `EARTH_RATE` = 7.292115e-5 rad/s; any other rate, of either sign, can be given.
- Measured on 600 states (orbits in km and in metres, random magnitudes, angles up to 1e8 rad, rates up to 0.1 rad/s), there and back: agreement with NAIF SPICE (`rav2xf`), SciPy and astropy within 5.2e-16 of |r| and of |v| + |rate| |r|; round trip within 3.4e-16.
- Every function returns two tuples of three floats or raises `ValueError`: vectors that are not three finite numbers within 1e15, an angle or a rate that is not finite or is out of range, booleans.

6. Export, use and certification

The package is published and freely available. That usually takes software out of export-control lists, but not every use of it: read the page on space activities and export control before using it in a controlled programme. It is not certified or qualified for flight; the evidence describes what was tested and how.

7. Citation and bill of materials

```
@software{cavazzini_star_rotframe_0_1_0,
  author  = {Cavazzini, Andrea},
  title   = {{star-rotframe}: Position and velocity between an inertial and a rotating frame},
  version = {0.1.0},
  year    = {2026},
  url     = {https://andrea07072000.github.io/S.T.A.R.-/software/star_rotframe/},
  note    = {Apache-2.0. Source: https://github.com/Andrea07072000/S.T.A.R.-, commit dc09f61}
}
```
